# Geography 485L/585L - Internet Mapping

#### Karl Benedict

# Spring 2018

# Week 2 - Module 2a - Web-based Mapping Clients. HTML, CSS & Javascript

#### Overview

- Web Development
- Parts of a web page
- Web Site Components
  - Structure (X/HTML)
  - Presentation (CSS)
  - Behavior (Javascript)
- Simple Web Pages
- More Complete Web Page Example

### Web Development

- Requirements
  - Web Server
  - File location that the web server accesses for requested content
  - Files must be readable by all users
- General Process
  - Create basic content in HTML or XHTML (structure)
  - Change appearance of content through the definitions of styles using CSS (presentation)
  - Add dynamic capabilities to content through Javascript (behavior)
  - REPEAT over and over and over again

#### Parts of a Web Page

```
<body>
9
          <!-- The body is where you put all of the content for the page
10
          (i.e. the material that will be displayed in the web browser)
          <h1>Headers</h1>
12
          <div>Generic blocks of content</div>
          Paragraphs
14
          Tables
          <img ...>Images</img>
16
          <form ...>Forms</form>
          Unordered Lists
18
          Ordered Lists
          List Items
20
          <!-- Javascript can go here as well -->
22
       </body>
23
   </html>
24
```

Link to example

#### Web Site Components - Structure

Content is defined in terms of the structural elements available in HTML/XHTML

- Sample HTML/XHTML Tags
  - Paragraphs (i.e. blocks of text) are contained within ...
  - Headings (i.e. section headings, sub-headings) are contained within numerically defined header tags: <h1>...</h1>, <h2>...</h3>, etc.
  - Tabular data are within ... tags
  - List are specified within ... or ... tags, depending upon whether the list is ordered (numbered) or unordered (e.g. bulleted)
  - User input elements are put within <form>...</form> tags
  - Blocks of content (i.e. sections or divisions) are defined within <div>...</div> tags
- Structure is translated into the Document Object Model (DOM) for later use by CSS and Javascript

#### Web Site Components - Presentation

Modifications to default rendering of HTML/XHTML elements are made through styles defined in CSS

- Styles may be
  - defined in an external file that is referenced within the <head> block (the preferred method when doing "real" web development)
  - directly defined within the <head> block of a web page
  - directly embedded in the elements to which they apply (generally not a "Good Thing")
- When not embedded within an element, a style definition consists of
  - A selector
  - The style definition, enclosed in "curly-brackets", separated by "semi-colons"
  - For example: h1 {color:red; font-size:18px;}

#### CSS Selectors

Selectors may be based on several criteria

- Element name: h1, p, table, ul, etc.
  - Element: <h1>A top level heading</h1>
  - Selector: h1 {color:red; font-size:18px}
- Element ID: a unique name assigned to HTML/XHTML elements within the structure of the document
  - Element: Some text goes here
  - Selector: #para01 {color:blue; font-size:12px}
- Class ID: a name assigned to multiple elements which may be modified through reference to their class
  - Element: class="instructions">Here are some instructions
  - Another Element: Here are some more instructions
  - Selector: .instructions {color:red; font-size:12px; text-decoration:blink}
- Selectors may be combined in a variety of ways

# Web Site Components - Behavior

The most interoperable language for adding dynamic behavior to web sites is Javascript - supported by most browsers on most operating systems

- A full-fledged programming language
  - A non-trivial undertaking to become proficient in
  - Experience in other programming languages can contribute to learning Javascript
- Defines actions that may be taken on/by DOM elements
- Allows for modification of existing DOM elements, creation of new DOM elements after the page has finished loading from the server, retrieval of new content after page loads
  - An interactive web page that may behave like a local desktop application

# Simple Web Page

```
<html>
       <head>
2
           <meta http-equiv="Content-Type" content="text/html;charset=utf-8" />
           <title>This is a simple web page</title>
       </head>
       <body>
           <h1>They don't get any simpler than this!</h1>
           OK, not much simpler than this.
           Hello World?
       </body>
10
   </html>
11
